

Installation Guide

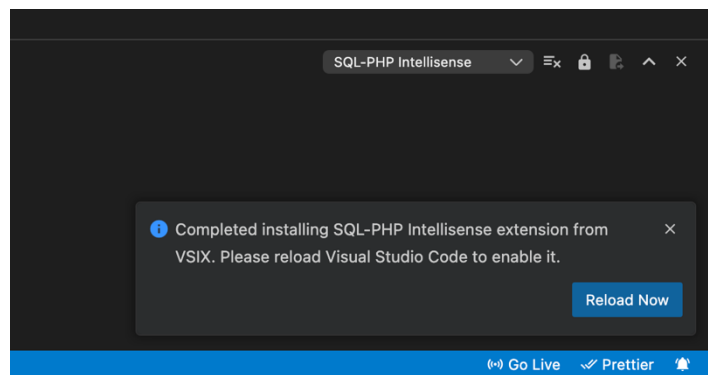

Step 1

Select install from VSIX in the extensions tab of VSCode.

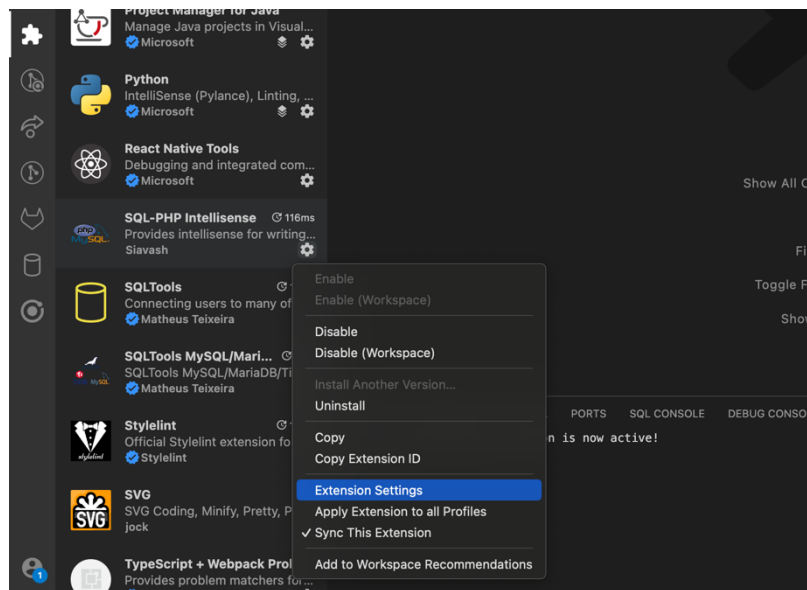

Step 2

Select the vsix file, you should now see this in the bottom right corner.

Step 3

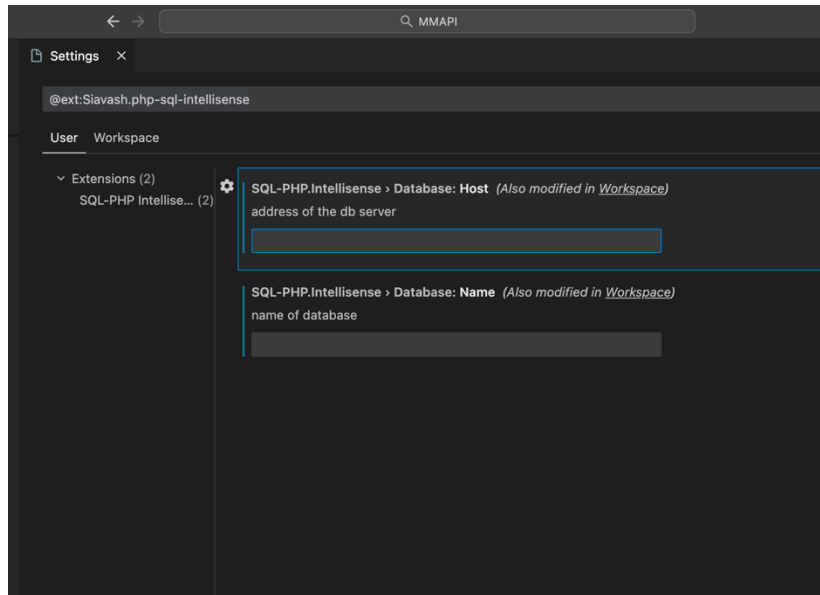

Find the extension and open its settings

Step 4

Enter address of database server and the name of database in either User or Workspace settings.

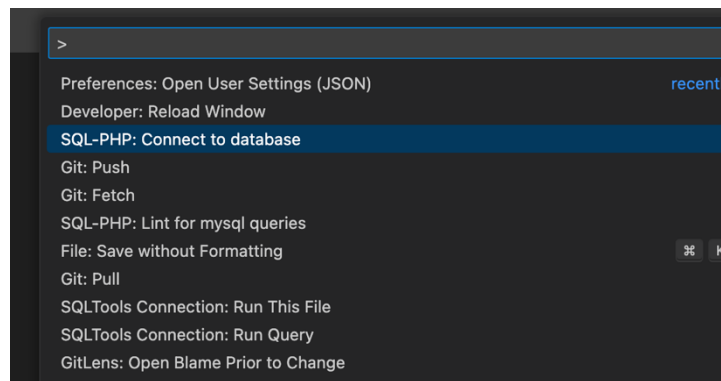

**Enter the address without the port, port is considered 3306 as default.*

Step 5

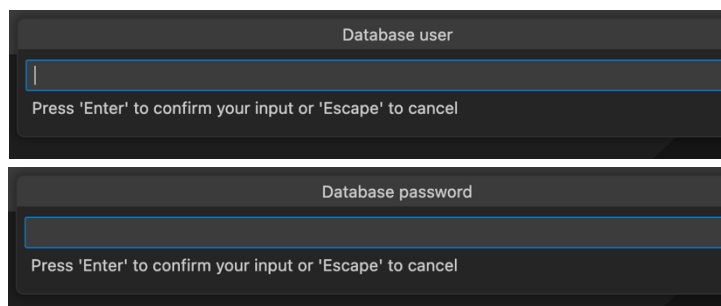

Open command palette and select the action **Connect to database**.

All of this extension's commands can be found by searching **SQL-PHP in the command palette.*

Step 6

Enter the username and password for your remote connection to database.

You should see a message window indicating that the connection was successful in the bottom-side corner after a few moments.

Username and password are stored in secrets and can only be cleared by the **Delete database credentials** command.
